

## The new MARIBO multi-layer pellet

In recent years, Danisco Seed has focused its research on improving the properties and quality of the seed pellet. This has resulted in a new multi-layer pellet that performs better under both wet and dry conditions. The composition of the new pellet allows the seed to quickly

absorb water and keep the moisture in the pellet. From here only the necessary amount of water will be released to the embryo.

The roundness and strength of the pellet has also improved, making it easier and safer to handle in sowing.

- **INNER LAYER:** Controls the release of optimum amount of water to the embryo. Ensures access to oxygen for a prolonged time
- **OUTER LAYER:** Ensures that the pellet takes up water very quickly and that the moisture stays in the pellet
- **INNER COATING:** Contains insecticide(s) and fungicide(s) to protect the seedling during germination and establishment
- **OUTER COATING:** Protective green color coating easy for the grower to track in the soil

The new MARIBO multi-layer pellet is better at withstanding various stress factors during germination and establishment in the field.

Seed of superb quality
